

LACTOBACILLUS DELBRUECKII LE

Introducing: Vivoflora strain *Lactobacillus delbrueckii* LE. This highly active LAB strain was isolated from a natural dairy product. *L. delbrueckii* LE exhibits strong immunomodulating qualities. It also works well alongside chemotherapy drugs and radiotherapy, is highly anti-mutagenic, and has good detoxification attributes. This strain also exhibits high antagonistic activity against pathogens.

TARGET APPLICATION: Perfect strain for special foods and supplements to maintain immune health and protect against the consequences of infectious diseases, support chronic states, and support all types of medical treatments.

FUNCTIONAL CHARACTERISTICS AND EFFICACY

L. delbrueckii LE assists the restoration and balancing of the microbiota and serves as a potent immune modulator that balances and normalizes non-specific reactions working through cellular immunity. This strain also has the ability to support the immune system function during chemotherapy, radiotherapy and toxic influences of different natures reducing endogenous intoxication. It is also effective in antagonistic functions against pathogenic and food spoilage microorganisms.

Digestive Health Functionality

L. delbrueckii LE has high levels of survival in the human intestine as well as high resistance to bile salts, gastrointestinal enzymes and acids and exhibits good adhesion properties in vivo. This strain also has the ability to restore integrity to gastrointestinal epithelial cells.

Immune System Modulation

L. delbrueckii LE exhibits superior immune modulating properties. It affects innate and adaptive immunity through both non-specific and specific links thus controlling coordination of the immune response by TH1 and TH2 pathways depending upon the immune status of the subject. This strain demonstrates a high ability to induce specific antibody production and balances the human immune system by stimulation of the production of key cytokines IFNs, TNF, NK cells, IL-1, IL-2, and IL-6 for protection against infections and cancer cells. It also serves as an immune modulator that balances and normalizes non-specific reactions working through cell-mediated immunity and induces higher responses in the presence of pathogenic agents. It provides immune balancing (via suppression) with respect to chronic diseases, inflammation, and immune imbalance caused by different agents such as tumors. *L. delbrueckii* LE thereby modulates immune response to both endogenous and exogenous pathogenic agents.

Anti-Mutagenic and Detoxification Properties

L. delbrueckii LE shows strong resistance to chemotherapy drugs and a high level of adhesion in their presence. This strain provides deep correction to immune imbalance, protection from all harmful impacts of chemotherapy and radiation, reduction of endogenous intoxication and suppression or blockage of TNF activity.

Protective Functionality

Lactobacillus delbrueckii LE demonstrates antagonistic activity against pathogenic and conditionally-pathogenic microbes to create a favorable environment for development of useful gastrointestinal microflora. In particular, it exhibits antagonistic activity against Gram Positive and Gram Negative pathogens including those found in hospital infections, post operative infections and complications as well as antagonistic activity against food spoilage organisms. *L. delbrueckii* LE also maintains antagonistic activity in the presence of some widely used antibiotics.

CLINICAL STUDIES

L. delbrueckii LE was clinically used for patients including children with various gastrointestinal disorders and immune system problems including allergic infections. This study demonstrated a 75-95% positive effect against gastrointestinal pathogens, Candida and viruses. This combination of strains normalized immune profiles and restored microflora and epithelial tissue. Clinical testing was done in the Russian State Medical University (Moscow), State Military Academy (St. Petersburg), Harkov Gastro-intestinal Hospital (Harkov, Ukraine), and Donetsk Medical University, Immunology Department (Donetsk, Ukraine).

L. delbrueckii LE alone and in probiotic composition with *L. rhamnosus* LB3 was clinically used for patients with different otolaryngology infections, including Candida and viruses, digestion and immune problems with 85-95% positive clinical effect, restoration of normal microflora, and normalization of enzyme and immune profiles. Clinical testing was done in the Hospital of Institute of Otolaryngology Academy of Medical Sciences, Kiev, Ukraine, 2002-2006, State Program "New Probiotics for Otolaryngology".

STRAIN ORIGIN & HISTORY

Lactobacillus delbrueckii LE (IMB B-7037) was isolated from a natural dairy product.

STRAIN AUTHENTICITY & DEPOSIT

According to FAO/WHO, this strain has been identified as *Lactobacillus delbrueckii* subsp. *bulgaricus* by use of phenotype, carbohydrate utilization or fermentation profile, and genetic ribotype technique. This strain has been deposited in the Ukrainian Strain Collection of Industrial Microorganisms as *L. delbrueckii* subsp. *bulgaricus* LE IBM B-7037.

SAFETY ASSESSMENT

A safety assessment has been performed for acute and chronic toxicity using rats and mice. The LD50 in acute testing was >20g/kg body mass. A culture of this strain is safe, non-toxic and has no embryotoxic, no mutagenic, no teratogenic and no carcinogenic effects. *L.delbrueckii* LE has been used for various food applications in the United States and for medical application in the Ukraine. *L. delbrueckii* species has a history of long term and wide spread use for food, food supplements and food culture, and is generally regarded as safe (GRAS).
